1. **Safety precautions**
   - Use supply voltage and interfaces indicated in the scanner specifications.
   - In connection/disconnection of cables, the scanner power must be switched off.
   - Do not use scanners in locations close to powerful light sources.
   - To obtain stable results, wait about 20 minutes after scanner activation to achieve uniform scanner warm-up.
   - Scanners must be grounded.

2. **CE compliance**
   Laser scanners have been developed for use in industry and meet the requirements of the following Directives:
   - EU directive 2014/30/EU. Electromagnetic compatibility (EMC).

3. **Laser safety**
   Scanners belong to 2M laser safety class according to IEC/EN 60825-1:2014. Scanners make use of an c.w. 660 nm or 405 nm or 450 nm or 808 nm wavelength semiconductor laser. Maximum output power is 10 mW. The following warning label is placed on the scanner housing:

   ![Laser Radiation Warning Label]

   The following safety measures should be taken while operating the scanners:
   - Do not target laser beam to humans.
   - Do not disassemble the scanner.
   - Avoid staring into the laser beam.

4. **General information**
   Laser scanners are designed for non-contact measuring and checking of surface profile, position, displacement, dimensions, sorting and sensing of technological objects, 3D models construction.

5. **Structure and operating principle**
   Operation of the scanners is based on the principle of optical triangulation (see Figure below).

   Radiation of a semiconductor laser is formed by a lens in a line and projected to an object. Radiation scattered from the object is collected by the lens and directed to a two-dimensional CMOS image sensor. The image of object outline thus formed is analyzed by a FPGA and signal processor, which calculates the distance to the object (Z-coordinate) for each point of the set along the laser line on the object (X-coordinate). Scanners are characterized by the beginning of the range (SMR) for Z-coordinate, measuring range (MR) for Z-coordinate, measuring range for X-coordinate at the beginning of Z (Xsmr) and measuring range for X-coordinate at the end of Z (Xemr).
6. Configurations, operating modes, and options

Scanners are available in the following versions:
- based on red laser, 660 nm;
- based on blue lasers (BLUE version), 405 or 450 nm;
- based on infrared laser (IR version), 808 nm.

We use different lasers due to a wide range of applications. For example, the use of blue lasers instead of red ones is optimal for the control of shiny materials, high-temperature objects and organic materials.

The use of scanners with lasers of different wavelengths in one measurement system makes it possible to avoid the scanners mutual influence and greatly simplifies the system construction.

Scanners can be equipped with a built-in heater for operation under low-temperature conditions. Scanners can be equipped with an air (water) cooling system and air-knife system for windows.

There are two operating modes in the full working range: with frequencies of 484 Hz (profiles/second) and 938 Hz (DS mode).

In addition, you can use the ROI function, which makes it possible to increase the working frequency of the scanner in the limited working range up to 5096 Hz and up to 6800 Hz in the DS mode.

Figure 3 | L=326 mm | 2 |
Figure 3 | L=283 mm | 1.9 |
Detailed CAD documentation (2D and 3D) is available here:
https://riftek.com/media/documents/rf627/CAD/2D_CAD.rar
https://riftek.com/media/documents/rf627/CAD/3D_CAD.rar

The scanner housing is made of anodized aluminum. The front panel of the housing has two windows: the output window and the window for receiving radiation reflected from the object under control. Overall and mounting dimensions of the scanners are shown in the Figures below. The housing has fastening holes for installing the scanner on the equipment. The sensors, shown in Figure 3, are equipped with an adjustable support that allows you to implement three options for mounting the scanner.

The scanner has two connectors, Reset button, and LED indicators.

**Example.** RF627BLUE-70/50-30/42-5 – Scanner with a blue laser, SMR - 70 mm, MR - 50 mm, Xsmr - 30 mm, Xemr - 42 mm, cable length - 5 m.

9. **Overall demands for mounting**

The scanner should be positioned so that the object under control has to be placed within the working range of the scanner. In addition, no foreign objects should be allowed to stay on the path of the incident and reflected laser radiation.

Where objects to be controlled have intricate shapes and textures, the incidence of mirror component of the reflected radiation to the receiving window should be minimized.

**ATTENTION!**
The scanner must be grounded. Static electricity may cause the failure of electronic components.

10. **Connection**

The scanner is shipped with two cables:
1) Ethernet cable;
2) Power cable with synchronization lines and outputs.

10.1. **Designation of connector contacts**

The scanner is equipped with two connectors:
1. Ethernet connector.

View from the side of connector contacts is shown below:

**Connector 1**
(Binder 712 Series, #09-0427-80-08)

**Connector 2**
(SACC-DSI-M12MS-12CON-M12)

Designation of contacts is given in the tables below.
## Connector 1:

<table>
<thead>

</tr>
</tbody>
</table>
### 10.3. Button and indication

To reboot the scanner, press the **Reset** button for 5 seconds. If you press the **Reset** button for 1 second, a broadcast Hello packet will be sent.

Red LED - the firmware is loading, green LED - the Ethernet connection is established.

### 11. Ethernet interface

Profiles are transmitted via the UDP protocol, the structure of packets is described in the Programmer’s Guide. Download link: [https://riftek.com/media/documents/rf627/RF627_SDK_and_Service_Protocol_eng.pdf](https://riftek.com/media/documents/rf627/RF627_SDK_and_Service_Protocol_eng.pdf)

The scanner can be controlled by the service protocol described in the Programmer’s Guide, or via the WEB interface built into the scanner.

### 12. Network configuration and the first connection

#### 12.1. Network configuration

All scanners are shipped with the following network configuration unless otherwise specified in the order:

- Autonegotiation of connection speed (100/1000 Mbps)
- IP address of the scanner: 192.168.1.30
- Subnet mask: 255.255.255.0
- Gateway: 192.168.1.1
- Host IP address (device that receives profiles): 192.168.1.2
- Host port that receives data: 50001
- HTTP connection port (for connecting a browser): 80
- Service port of the scanner: 50011

Since the laser scanner is configured to work in the 192.168.1.* address space, configure the network card of your PC, for example, as follows:

<table>
<thead>
<tr>
<th>Color</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>White</td>
<td>NEXT_LAS_OFF</td>
</tr>
<tr>
<td>Green</td>
<td>IN1+</td>
</tr>
<tr>
<td>Yellow</td>
<td>IN1-</td>
</tr>
<tr>
<td>Violet</td>
<td>OUT1+</td>
</tr>
<tr>
<td>Red</td>
<td>VIN</td>
</tr>
<tr>
<td>Blue</td>
<td>GND</td>
</tr>
<tr>
<td>Brown</td>
<td>0V</td>
</tr>
</tbody>
</table>
The network settings of the scanner can be changed using the service software (SDK), the service protocol, or via the web page of the scanner. **NOTE:** Ethernet Jumbo frames are not supported.

### 12.2. First connection

- Perform the network configuration in accordance with the previous paragraph.
- Connect the scanner to the PC or to the network switch.
- Connect the power supply (9...30V) to the scanner (cable #2, a red wire is "plus" of the power supply, a brown wire is "minus").

Within 8 seconds after powering on, the FPGA firmware is booting and the Ethernet interface is initializing (the red LED blinks).

Next, it is recommended to check the connection using the console command "ping 192.168.1.30 (or the current IP address of the scanner)". If all the settings are correct, the scanner will respond to the command. A typical result is shown below:

```
C:\Users\admin>ping 192.168.1.30
Pinging 192.168.1.30 with 32 bytes of data:

64 bytes from 192.168.1.30: icmp_seq=0 ttl=64 time=0.1 ms
64 bytes from 192.168.1.30: icmp_seq=1 ttl=64 time=0.1 ms
64 bytes from 192.168.1.30: icmp_seq=2 ttl=64 time=0.1 ms
64 bytes from 192.168.1.30: icmp_seq=3 ttl=64 time=0.1 ms

--- 192.168.1.30 ping statistics ---
    4 packets transmitted, 4 received, 0% packet loss, time 3003ms
Round-trip: min 0.1 ms, max 0.1 ms, average 0.1 ms
```

The scanner is ready to operate.
To turn off the scanner, turn off the power supply.

### 13. Software and resources

The scanner comes with a software package, which is also available on the RIFTEK's web site.

The package includes software tools that allow to implement two ways of working with the scanner:
1. Via the web page (see par. 14).
2. Via the software developed by the customer using the provided SDK (Software Development Kit). RF627 SDK includes the detailed description of all functions of the library and the examples of programs in different languages (C++, C#) ported to various platforms (Windows, Linux, .NET), and also the examples of using the libraries in different environments (MATLAB, LABVIEW). See the Programmer's Guide (the download link is given in par. 11).

14. **Web page**

The web page is intended to check the operation and configure parameters of the scanner. To access the web page, enter the IP address of the scanner into the address bar of the web browser:

The web page contains four areas (shown above):
1. Scanner status indicators.
2. Parameterization tabs.
3. Result and status display tabs.
4. Control buttons.

Area 1 contains the following indicators:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Icon" /></td>
<td><strong>Device info</strong></td>
<td>Model name and serial number of the scanner. Serial number is a unique identifier of the scanner and is assigned by the manufacturer.</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td><strong>Connection status</strong></td>
<td>The status of connection with the scanner. If the connection is established, the Link caption and the connection speed value will be displayed in this field. The Required caption displays the recommended connection speed required for correct operation of the device. The recommended speed depends on the operation mode of the scanner. If communication with the scanner is lost (for example, when the scanner is restarted or the connection is broken), the web page will be displayed, but the connection status will change to <strong>Disconnected</strong>.</td>
</tr>
<tr>
<td><img src="image" alt="Icon" /></td>
<td><strong>Triggering mode</strong></td>
<td>Measurement triggering mode, in which the scanner is operating now. See par. 21.</td>
</tr>
</tbody>
</table>
### Profile settings

The current profile data format (Format) and the current number of profiles per second (FPS) sent by the scanner via the UDP protocol. The value may vary depending on the operating mode of the scanner and its settings.

### Temperature °C

Processor temperature (CPU) and internal temperature of the scanner (Internal) in °C. This information is used to assess the operating conditions of the scanner. Do not allow the temperature to rise to 90°C or more. When the permissible temperature is exceeded, the indicator starts blinking.

### Total work time

Operating time after switching on (Work) and total operating time of the scanner (Total).

Area 2 contains the following tabs:
- **General**: General scanner settings, including parameters of CMOS-sensor and data streams.
- **Profile processing**: Profile processing settings and control of profiles accumulation in scanner memory.
- **Network**: Network settings of the scanner.
- **Triggering**: Settings of input channels of the scanner (triggering modes) and output channel for synchronization of work of several scanners.
- **System**: System settings of the scanner, including support for compatibility modes, etc.

Area 3 contains the following tabs:
- **Info**: General information about the scanner (firmware version, working range, etc).
- **Viewer**: Viewing the current profile, or viewing profiles accumulated in internal memory with the ability to display as a 3D point cloud, or viewing the intensity image.
- **Video**: Video signal view.
- **Log data**: Information about the scanner operation.

Area 4 is located in the upper right corner and contains the control buttons:

<table>
<thead>
<tr>
<th>Button</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Save configuration]</td>
<td><strong>Save configuration</strong></td>
<td>Save settings to the flash memory of the scanner. The exclamation mark means that the parameters have been changed, but haven't been saved.</td>
</tr>
<tr>
<td>![Load defaults]</td>
<td><strong>Load defaults</strong></td>
<td>Restore the factory settings. <strong>Important</strong>: It is necessary to restart the scanner after restoring the factory settings. Click the <strong>Restart device</strong> button.</td>
</tr>
<tr>
<td>![Restart device]</td>
<td><strong>Restart device</strong></td>
<td>Restart the scanner.</td>
</tr>
</tbody>
</table>

### 15. Search for scanners on the network and connection

Enter the IP address of the scanner into the address bar of the web browser and press the **Enter** key. If the scanner is on the network, the browser will display its web page.

If all the settings are correct and the entered IP address is the IP address of the scanner, the **Status** field will show **Connected**. The scanner is ready to operate.
16. **Obtaining the image, profile and intensity**

The scanner can transmit:
- the image of the laser line on the object surface, and / or
- uncalibrated profile extracted from the image, or
- calibrated profile (profile in Cartesian coordinates of the scanner)
- profiles accumulated in internal memory in two modes:
  - two-dimensional profile
  - three-dimensional point cloud
- 3D intensity image
Profile and image view modes are used when configuring parameters of the scanner.

16.1. **"Video" tab. Image view**

To view the image, place an object within the working range of the scanner, go to the Video tab, and click Play ►.

The ◯ and ◄ icons mean that you cannot / can simultaneously view an uncalibrated profile (see Data stream options in the General tab). The image transmission rate is about 10 frames/second.

To zoom in/out the image, rotate the mouse wheel or use the buttons located in the upper right corner of the window. Returning the image to the original size is done by double-clicking in the image area.

To move the image, hold down the left mouse key and drag the image to the required position. You can save the image of the current frame. To do this, right-click in the image area and select "Save image as ..." and then specify the image name (image format is .png).

The image is displayed on two screens. On a small screen, the yellow rectangle shows the position of the viewing area:

![Image View](image.png)

In the example above, the image was zoomed in and the ◄ mode is enabled. Red color indicates a video signal, green color indicates an uncalibrated profile. When viewing the image in the calibrated profile mode, only the video signal is displayed.
16.2. "Viewer" tab. Data view

The Viewer tab is intended to visualize the data received from the scanner. This tab allows you to view:

- currently registered profile in real-time mode;
- profiles accumulated in internal memory in two modes:
  - two-dimensional profile;
  - three-dimensional point cloud.
- 3D intensity image.

To view the current profile in real-time mode, use the icons Play ➤ and Pause ⏸, which are located in the Viewer tab.

The Viewer window is divided into the following areas:

1 - Switching between viewing options.

The Profile tab displays a two-dimensional profile on a grid.

The 3D tab is intended to display the current profile, or a 3D point cloud from profiles accumulated in internal memory on a three-dimensional scene, or a intensity image of a scanned object.

2 - Managing the accumulation of profiles in internal memory.

This area contains a button intended to start recording profiles (it will be replaced by a stop button during recording), and an indicator of the internal memory free space, which displays the number of accumulated profiles and the maximum possible number of profiles for accumulation.
3 - Zooming.

- zoom in, - zoom out.

To restore the original scale, use the button or double-click the left mouse key in the viewing area in the Profile tab.

In addition, you can rotate the mouse wheel to zoom in / zoom out the image.

4 - Viewing area.

The viewing area in the Profile tab contains a coordinate grid. The vertical axis corresponds to the Z coordinate of the scanner, the horizontal axis corresponds to the X coordinate of the scanner. This grid displays the profile (1), the scanner range (2) and the ROI area (3) (if ROI mode is enabled). When you hover the mouse over the selected area of the grid, a cursor appears indicating the position in the scanner coordinates. Moving an image is done with the mouse while holding down the left key.

In Raw data mode (General tab > Data stream options section > Profile Data Format), an uncalibrated profile is displayed on the grid. The pixel dimension of the coordinate grid is px.

When you select the 3D tab, a three-dimensional scene will be placed in the viewing area, which will display either the current profile (in Actual mode) or a 3D point cloud formed from the profiles accumulated in memory (in Dump mode) or the intensity image.
To rotate the camera on a three-dimensional scene, use the left mouse key. To move the scene in horizontal, use the right mouse key. Zooming is done by the mouse wheel.

5. Scroll bar.

This area is active in **Dump** mode. Moving the slider determines the profile you are viewing. The button \(<\) calls the previous profile relative to the position of the slider, and the button \(>\) calls the next profile.

6. Selecting the view mode.

There are two modes:
- **Actual** - The viewing area displays the profile currently registered by the scanner in real time.
- **Dump** - The viewing area displays either the selected profile, or a 3D point cloud formed from the profiles accumulated in internal memory.
7. The coordinates of the profile point near the cursor.

This area displays the coordinates of the profile point that is most closely located to the vertical line of the cursor.

8. Parameters of the displayed profile.

This area displays the values of the Measurements counter and the Inputs pulse counter, as well as the direction of movement (rotation) along the Direction encoder (the description of the counters is given in the Programmer’s Guide). The Reset button resets both counters.

16.2.1. Accumulation of profiles in internal memory of the scanner

To start recording profiles to the scanner memory, click the button in Area 2 (see previous paragraph). After that, each profile will be stored in the internal memory of the scanner. The maximum number of profiles for recording is 80000. Recording is possible only in the Calibrated Profile format, otherwise the start button will be locked. During recording, you cannot change the data format and the Data stream options section will not be available.

NOTE: The accumulation of profiles is carried out in accordance with the selected Triggering mode (see par. 21).

During recording, it is also possible to view the resulting point cloud in real time. To do this, you must first configure the settings for displaying a point cloud (see par. 20.3). During recording, profiles are displayed with decimation and without coloring by height (all red).
After the accumulation process is completed in the view mode, all profiles (without decimation) will be displayed after clicking on the refresh button.

16.2.2. Viewing accumulated profiles

To view the accumulated profiles, you must select the Dump mode in Area 6 (Selecting the view mode).

When the Profile tab is selected in Dump mode, the selected profile from those accumulated in the internal memory will be displayed on the coordinate grid. When the 3D tab is selected in Dump mode, the accumulated profiles in the form of a three-dimensional point cloud will be displayed on the three-dimensional scene. You must first configure the display settings in the Dump control section (see par. 20.3):

- Select the type of displacement system when receiving a point cloud.
- Specify the step between measurements (linear in mm for the Linear type, and angular in degrees for the Radial type).
- Select the selector, which is used to build the point cloud (Measurement and Step counters or Time profile time stamp). The step value is multiplied by the value of the parameter selected by the selector.
- Select Coloring mode.

After configuring the display parameters, it is necessary to click on the refresh button (available only in Dump mode). After that, the data will be downloaded from the scanner and a point cloud will appear.
After changing any parameters in the **Dump Control** section, you must click the refresh button to redraw the point cloud with new parameters.

**NOTE:** To view a three-dimensional point cloud, you must have a video card of the appropriate level in your computer. To view a point cloud on weak computers, adjust the decimation of the point cloud. To do this, select the appropriate coefficient in the **Decimation of 3D surface** drop-down list.

![Point cloud without decimation](image-url)
To view a point cloud with coloring by intensity, you must select the **Intensity** mode for the **Coloring mode** parameter.

**NOTE:** Coloring by intensity is possible only if, during recording, the brightness values were included in the profile package (see p. 19.3). Otherwise, the brightness of all points will be zero (black color).
16.2.3. **Export of accumulated profiles**

When the **Profile** tab is selected in **Dump** mode, the **Save** button is available. If you click this button, the file with accumulated profiles in **.bin** format will be generated and downloaded from the scanner. The description of the **.bin** format is given in the Programmer’s guide.

To view the accumulated profiles in **.bin** format, use the **RFProfileView** program ([https://riftek.com/downloads/RFProfileView.zip](https://riftek.com/downloads/RFProfileView.zip)).

When the **3D** tab is selected in **Dump** mode, the **Export** button is available. If you click this button, the file with a point cloud in **.obj** format will be generated and downloaded from the scanner.

The **.obj** format is a commonly available format for describing 3D geometry and can be opened by almost any software for working with 3D objects (for example, the **MeshLab** software). Download link: [http://www.meshlab.net/#download](http://www.meshlab.net/#download)

17. **Setting parameters**

To configure the scanner settings, go to the required tab and make changes. All settings, except network settings, are applied immediately. In order for the network settings to take effect, it is necessary to click the **Change** button. All changes are made in RAM and will be lost when you restart the scanner. If you want to save parameters, write them to the nonvolatile memory of the scanner before restarting. Control buttons are located in the upper right corner of the window (see par. 14.).
18. "Network" tab. Network parameters

To configure the network parameters of the scanner, go to the Network tab.

![Network settings interface]

Current Network settings:

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

In order for the changes to take effect, it is necessary to click the Change button.

19. "General" tab. General parameters

19.1. Image quality settings

The intensity of the reflected light entering the scanner depends on the properties of the surface of the object under control. In turn, the value of electric signal generated by the CMOS image sensor of the scanner depends on the time of accumulation of radiation (exposure time). Therefore, in order to obtain optimal signal, it is necessary to set optimal exposure time.

Since the exposure time cannot exceed the frame duration, it is necessary to set the required frame rate (FPS parameter) before setting the exposure time.
19.1.1. Frame rate

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPS</td>
<td>484</td>
<td>The current number of profiles (frames) per second that the scanner processes and transfers.</td>
</tr>
</tbody>
</table>
| Double frame speed (DS Mode) | OFF           | Enable / disable the double frame rate mode:  
  - ON - enabled, the scanner works in the DS mode;  
  - OFF - disabled, the scanner works in the standard mode.  
  Note: In this mode, the linearity of the scanner for Z is reduced from ±0.05% to ±0.1% of the measuring range for Z. |

To set the FPS parameter, use the slider, or enter the required value into the field and press the Enter key (valid for standard operation mode, as well as for DS and ROI modes). The maximum possible value for the current mode is shown next to the FPS field.

19.1.2. Exposure time and laser power

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
</table>
| Exposure time, ns | 300000        | Exposure time of the CMOS sensor (signal accumulation time) in nanoseconds, step 10 ns. The minimum value is 3000 ns, the maximum possible value depends on the frame rate, the ROI and DS modes, and is limited to 1/FPS.  
  Note: The laser automatically turns on during the exposure time only. |
| Autoexposure    | OFF           | Enable / disable the autoexposure mode:  
  - OFF - manual mode;  
  - ON - autoexposure mode. |
| Laser ON/OFF    | ON            | Turn on / off the laser:  
  - OFF - laser is off;  
  - ON - laser is on. |
| Laser output power, % | 10            | Laser output power level. Range of values: 0...100%.  
  Note: The laser output power is adjustable only in manual mode. |

Exposure time and laser output power are set manually based on visual analysis of the quality of the image obtained from the image sensor, and on analysis of the quality of the resulting profile (see p. 16.).

To set the exposure time, use the slider, or enter the required value into the field and press the Enter key. For convenience, you can select Profile data format > Raw profile (see the Data stream options section of the General tab). In this case, the Video tab simultaneously displays a video signal and an extracted profile in the coordinate system of the CMOS sensor (uncalibrated data).
To enable the autoexposure mode, click **Autoexposure**. The scanner will automatically set the optimal exposure time.

<table>
<thead>
<tr>
<th>Exposure time is too high</th>
<th>Exposure time is optimal</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Exposure time too high" /></td>
<td><img src="image2" alt="Exposure time optimal" /></td>
</tr>
</tbody>
</table>

### 19.2. ROI settings

The **ROI** (region of interest) parameters control the size and position of the CMOS sensor active area. By default, the active area covers the entire area of the sensor. Decreasing the active area size allows to increase the scanner speed due to decreasing of the image reading time. Resizing is possible in Z-direction only and is performed in the coordinate system of the CMOS sensor.

**Parameters:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROI On/Off</td>
<td>OFF</td>
<td>Enable/disable the ROI mode:</td>

</tr>
</tbody>
</table>
### Laser Scanners. RF627 Series

#### 19.3. Data stream control

The Data stream options parameters control the data stream of the scanner and the resolution by X coordinate.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile data UDP stream on/off</td>
<td>ON</td>
<td>Enable/disable the UDP data stream.</td>
</tr>
<tr>
<td>X-Axis Resolution</td>
<td>1296</td>
<td>Number of points by X coordinate (648 or 1296).</td>
</tr>
</tbody>
</table>
| Profile data format            | Calibrated profile | Profile formats:  
|                                |               | - **Calibrated profile** - transfer of calibrated data (profile in Cartesian coordinates of the measuring area).  
|                                |               | - **RAW profile** - transfer of uncalibrated data (profile in the coordinate system of the CMOS sensor). Obtaining a profile in this format allows you to visually match the profile and the image formed by the CMOS sensor. This format is used for debugging.  
| Check delivery                 | OFF           | Enable/disable the requirement to confirm delivery of UDP packets with profiles:  
|                                |               | - **ON** - enabled;  
|                                |               | - **OFF** - disabled. |

**Example:** Automatic displacement of the region of interest with keeping the profile within the set boundaries (yellow lines).
20. "Profile processing" tab. Profile extraction settings

The Profile processing tab contains parameters that control the procedure for extracting a profile from an image and filtering points of a selected profile (Pre Processing section), as well as parameters that control the point cloud display parameters (Dump Control section).

20.1. "Pre Processing" section. Profile extraction parameters setting

The parameters of the Pre processing section define characteristics of the profile extraction algorithm.

### Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Include intensity in profile data</td>
<td>OFF</td>
<td>Include the point intensity values into the profile package:</td>
</tr>
<tr>

<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Interleaved HDR</td>
<td>OFF</td>
<td>This mode is designed to expand the dynamic range of the sensor. It is used in the control of complex objects containing areas with different reflectivity. The expansion of the dynamic range is achieved due to different exposure times for the even and odd columns of the CMOS sensor. For odd columns, the exposure time is lower. Exposure time reduction is determined by the Interleaved exposure divider coefficient.</td>
</tr>
<tr>
<td>Interleaved exposure divider</td>
<td>5</td>
<td>Exposure time reduction coefficient for odd columns of the CMOS sensor. It determines how many times the exposure time for odd columns is reduced relative to the main exposure time (Exposure time, ns on the General tab). It is available only when the Interleaved HDR mode is enabled. Possible values: 5, 10, 15, 20.</td>
</tr>
<tr>
<td>Exposure HDR (see par. 20.1.2)</td>
<td>OFF</td>
<td>This mode is designed to expand the dynamic range of the sensor. It is used in the control of complex objects containing areas with different reflectivity. The expansion of the dynamic range is achieved due to the use of a piecewise linear response of the CMOS sensor.</td>
</tr>
<tr>
<td>Image flip</td>
<td>NO</td>
<td>Flip the CMOS sensor image in the direction of the selected axes. Possible options: No - no flip; X - flip along the X axis of the scanner; Z - flip along the Z axis of the scanner; XZ - flip along both axes.</td>
</tr>
</tbody>
</table>

### 20.1.1. "Peak selection mode" parameter

The Peak selection mode parameter defines the algorithm for detecting the brightness peak in the column of the CMOS sensor to obtain the profile point. Changing this parameter helps to correctly extract the profile in the case of laser beam re-reflections from the object surface or in the case of brightening from external sources of optical radiation.

The intensity of the re-reflected beam or brightening from external light sources can sometimes exceed the intensity of the laser line. In this case, you can use the modes with an indication of a more specific detection point.

**Example:**

![Re-reflections of a laser beam on the object having a complex profile](image-url)
The **Max Intensity** value determines the selection of the profile point based on the maximum brightness of the image in the CMOS sensor column. The brightness of the re-reflected signal may be greater than the brightness of the original signal. The scanner incorrectly selects the profile, placing it both on the initial laser line and on the re-reflexion.

The **First** value determines the selection of the first peak in the CMOS sensor column. The scanner selects a profile by a re-reflected signal.

The **Last** value determines the selection of the last peak in the CMOS sensor column. The scanner selects a profile by a real signal.
20.1.2. "Exposure HDR" parameter

The Exposure HDR parameter is intended to expand the dynamic range of the scanner. It is used in cases when you need to scan the surfaces with different reflectance.

Scanner sees two objects: one of light color and the other of dark color.

With a lower exposure time, the profile of the object of light color looks well-defined; black object shows only a few profile points.

When increasing the exposure time, the black object profile is well-defined, but the light one is not.

The exposure time is the same as in the previous figure, but the Exposure HDR mode is turned on. Profiles of both objects are well-defined.
20.2. "Post Processing" section. Filtering

The parameters of the Post processing section define the operations performed directly on the profile points.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Suppression of unstable points</td>
<td>OFF</td>
<td>ON - unstable points will be deleted from the profile (the points are considered unstable if they are not detected at least once in 128 profiles in a row).</td>
</tr>
<tr>
<td>Median filter width</td>
<td>0</td>
<td>The size (number of points) of the median filter window. Possible values: 0, 3, 5, 7, 9, 11, 13, 15. If the value is set to &quot;0&quot;, the filter is disabled.</td>
</tr>
<tr>
<td>Bilateral filter width</td>
<td>0</td>
<td>The size (number of points) of the bilateral smoothing filter window. Possible values: 0, 3, 5, 7, 9, 11, 13, 15. If the value is set to &quot;0&quot;, the filter is disabled.</td>
</tr>
</tbody>
</table>

20.3. "Dump Control" section. Building 3D models

The parameters of the Dump Control section define the parameters for displaying a three-dimensional point cloud.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of displacement system</td>
<td>Linear</td>
<td>Type of mechanical displacement system for obtaining a point cloud:</td>

<tr>
<td>Step size, mm</td>
<td>0</td>
<td>Step size between measurements (in millimeters for the Linear system, and in degrees for the Radial system).</td>
</tr>
<tr>
<td>Step selector</td>
<td>Time</td>
<td>Selector, which is used to build a point cloud. The step value is multiplied by the value of the parameter selected by the selector.</td>
</tr>
<tr>
<td>Coloring mode</td>
<td>Heightmap</td>
<td></td>
</tr>
<tr>
<td>Parameter</td>
<td>Factory value</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Coloring mode</td>
<td>Heightmap</td>
<td>Point cloud coloring mode:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Heightmap</strong> – Coloring by height (for the Linear system) or according to removal from an axis (for the Radial system);</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <strong>Intensity</strong> – Coloring according to the pixel intensity values. Note: Coloring in <strong>Intensity</strong> mode is possible only if intensity</td>
</tr>
<tr>
<td></td>
<td></td>
<td>values have been included in the profile package (see par. 19.3.).</td>
</tr>
</tbody>
</table>

21.1. Time cycle

Image capture, processing (profile extraction) and result transfer are performed in a pipeline mode. The pipeline mode is illustrated by the following diagram:

![Pipeline mode diagram](image)

**Description:**

<table>
<thead>
<tr>
<th>T</th>
<th>Frame (profile) period.</th>
</tr>
</thead>
<tbody>
<tr>
<td>FPS</td>
<td>Frame (profile) rate.</td>
</tr>
<tr>
<td>N-1, N</td>
<td>Frame (profile) numbers.</td>
</tr>
<tr>
<td>Event</td>
<td>Event that triggers the measurement cycle of obtaining a single frame (profile).</td>
</tr>
<tr>
<td>Exposure time</td>
<td>Exposure time of the image sensor.</td>
</tr>
<tr>
<td>Laser ON time</td>
<td>Time during which the laser is turned on.</td>
</tr>
<tr>
<td>Profile extraction and transfer</td>
<td>Time required to extract the profile and start its transfer.</td>
</tr>
</tbody>
</table>

The measuring cycle (start of measurement to take one profile) always begins with an event, the sources of which are described in the next paragraph. Upon the occurrence of the event, the electronic shutter is opened and the laser is turned on, i.e. the CMOS sensor is exposed. At the same time, the previous frame is read, processed (profile is extracted from image) and transmitted.
21.2. Triggering modes

The Inputs section of the Triggering settings tab is intended to set up the measurement triggering modes. The required mode is selected from the drop-down menu:

If the selected mode allows for options, set the required values in the appropriate fields:

![Triggering modes diagram]

Description of triggering modes:
<table>
<thead>

<td>Each measurement starts with receiving the software request.</td>
<td></td>
<td>See Programmer's Guide.</td>
</tr>
</tbody>
</table>

Notes:

1. The maximum processed frequency at the inputs #1, #2 and #3 is 10 MHz. If the event arriving rate is higher than the FPS, the measurement is started at the closest event after the end of the current cycle. The minimum allowable pulse duration is 40 ns. When using the Input divider, the frequency of the events, triggering the measurement, equals to (input frequency) / (divider value).

2. The data packet with the profile coordinates, transmitted by the scanner (see the Programmer’s Guide), carries information about the contents of several cyclic counters, allowing you to control the integrity of the data:
   - System time counter for the beginning of each measurement.
   - Input pulse counter. This counter is incremented by the input signal (input signals for modes #4 and #5). The counter is not reversible. The indication of the direction is transmitted in the data packet.
   - Measurement counter (frame counter). This counter is incremented by the event that triggers the measuring cycle.

22. "Triggering settings" tab. Synchronization of multiple scanners

Where measurements are made by several scanners, it is often necessary to ensure synchronous measurements, in order, for example, to combine profiles obtained from different parts of the moving object into a single profile.

When installing scanners in a line or around an object or opposite each other, it becomes necessary to ensure asynchronous measurements in order to eliminate the mutual influence of laser beams on each other.

To synchronize the operation of multiple scanners, the OUT output of one of the scanners is used. The Rise of the scanner output signal always corresponds to the moment of switching on the laser of the scanner (the beginning of the integration time), the signal Fall corresponds to the moment of switching off the laser (the end of the integration time). The output signal delay relative to the on / off time of the laser is about 50 ns.

22.1. Synchronous measurements

There are two options for connecting the scanners for synchronous measurements.

Option 1.
All scanners in the system are configured to work in one of the 8 modes #1...#8, (mode #0 is not used). The event source is connected simultaneously (in parallel) to all scanners.

Option 2.
- One of the scanners (Master) is configured in the required mode, #0...#8.
- The OUT Master output is initialized.
22.2. Asynchronous measurements

To perform asynchronous measurements, scanners are connected as follows:
- One of the scanners (Master) is configured in the required mode, #0...#8.
- The other scanners (Slave type 1 and Slave type 2) are switched to mode #1 (External trigger).
- For nearby scanners (Slave type 1 and Slave type 2), the following options are set: Measurement start - Fall and Measurement start - Rise.
- The OUT Master output is initialized.

As a result, the lasers of the scanners of the "Master + Slave type 2" group and the "Slave type 1" group will alternately turn on.

Note: The total accumulation time of the Slave type 1 and Slave Type 2 scanners must not exceed the measuring cycle time = 1 / FPS.

23. "System" tab

23.1. Scanner name change. Log files

In the General section, you can change the scanner name by typing a new name into the field and clicking Change, or you can enable / disable saving the log file to the internal memory of the scanner.
23.2. Compatibility with RF625 scanners

In the Compatibility section, you can switch the scanner to Protocol backward compatibility mode by changing the OFF state to ON. In this mode, data (profiles) are transmitted according to the RF625 scanner protocol. Parameterization is carried out through the WEB-interface.

**NOTE:** When the Protocol backward compatibility mode is enabled, it is not possible to change the Profile data UDP stream parameter on / off in the Data stream options section (see par. 19.3).

23.3. Firmware update

To update firmware, go to the Firmware update tab.

- Click Choose File and select the firmware file.
- Click Upload to upload the selected file.
- Click Start to start the update process. You will see:
  
  - Don't turn off the power during the firmware update process!
  
  Scanner will restart after 75 seconds
If the IP address settings haven't been changed after completing the firmware update process and restarting the scanner, the web interface will automatically reboot without waiting for the timer to expire. If the network settings have been changed, the web interface will reboot with the default IP address (192.168.1.30) after the timer expires.

23.4. **Calibration table update**

To update the calibration table, select the **Calibration table write** tab.

- Click **Choose File** and select the calibration table file.
- Click **Upload** to upload the selected file.
- Click **Start** to start the update process. In case of successful update, you will see:

<table>
<thead>
<tr>
<th>Serial</th>
<th>Scanner serial number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Save date</td>
<td>Table creation date</td>
</tr>
<tr>
<td>Save time</td>
<td>Table creation time</td>
</tr>
<tr>
<td>CRC</td>
<td>Checksum. OK - table is uploaded correctly, ERR - file is damaged, uploading is impossible</td>
</tr>
</tbody>
</table>

24. **"Info" tab**

The **Info** tab displays general information about the scanner.

---

### Device Information

- **Model:** Laser scanner
- **Wavelength:** 650 nm
- **Firmware version:** 19.6.10.0
- **Hardware version:** 18.6.20.0
- **Config version:** 19.6.5.0
- **FSBL version:** 19.4.11.0

### Working Ranges

- **Base Z:** 121 mm
- **Range Z:** 200 mm
- **Range X Start:** 60 mm
- **Range X End:** 165 mm

### Trigging

- **Mode:** Internal clock
- **Output:** Enabled
25. "Log data" tab

The Log data tab displays information about the scanner operation that can be used to detect errors:

This tab contains information about the operations performed and their order.

26. Maintenance

The Laser Scanners is virtually maintenance free. As these are optical systems, they are sensitive to dust and sputter on the front windows. Cleaning is best done with a soft cloth. Do not use scratching cleaners or other aggressive media.

It is necessary to remove fingerprints from the windows, because fingerprints degrade the quality of profiles.

In order to remove fingerprints or grease, clean the windows with 20 % alcohol and soft paper.

27. Troubleshooting

<table>
<thead>
<tr>
<th>Problem</th>
<th>Cause</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Laser is off</td>
<td>No power supply (or less than 9 V)</td>

</tbody>
</table>
### 28. Annex 1. Recovery Mode

**Recovery** mode is intended to restore the scanner operability in case of hardware failures or after incorrect user actions.

To activate this mode, it is necessary to turn on the scanner with the **Reset** button pressed and continue to hold this button pressed for at least 10 seconds.

In this mode, the **PWR** indicator displays the SOS signal (three short - three long - three short), which means that the scanner is in **Recovery** mode now.

After turning off the scanner, it will operate in basic mode when turned on again.

In **Recovery** mode, when you enter the IP address of the scanner into the address bar of the browser, a simplified WEB page will be loaded. In this page, you can perform the following actions:

- view general scanner settings;
- update the firmware of the scanner;
- view and, if necessary, change the network settings;
- view the log file.

The WEB page in **Recovery** mode is shown below:

![Recovery Mode WEB Page](image)

Area 1 contains tabs, switching between which you can view or set the required parameters.

Area 2 contains control buttons:
### 28.1. "General" tab

The General tab has two sections: **Scanner information** and **Firmware update**.

#### 28.1.1. Scanner information

The **Scanner information** section contains the following information:
- Device ID;
- Scanner name;
- Serial number;
- Firmware version;
- Measurement ranges.

<table>
<thead>
<tr>
<th>Scanner information</th>
<th>Model</th>
<th>RF627</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Scanner name</td>
<td>RF627 2D Laser scanner</td>
</tr>
<tr>
<td></td>
<td>Serial number</td>
<td>7057566</td>
</tr>
<tr>
<td></td>
<td>Firmware version</td>
<td>19.4.9.0</td>
</tr>
<tr>
<td></td>
<td>Base Z</td>
<td>121 mm</td>
</tr>
<tr>
<td></td>
<td>Range Z</td>
<td>200 mm</td>
</tr>
<tr>
<td></td>
<td>Range X Start</td>
<td>60 mm</td>
</tr>
<tr>
<td></td>
<td>Range X End</td>
<td>166 mm</td>
</tr>
</tbody>
</table>

#### 28.1.2. Firmware update

The **Firmware update** tab makes it possible to update the scanner firmware.

The firmware update procedure is described in par. [23.3](#).
28.2. "Network" tab

To configure the network parameters of the scanner, go to the **Network** tab.

Parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Factory value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>192.168.1.30</td>
<td>IP address of the scanner.</td>
</tr>
<tr>
<td>Gateway</td>
<td>192.168.1.1</td>
<td>Gateway address.</td>
</tr>
<tr>
<td>Subnet mask</td>
<td>255.255.255.0</td>
<td>Network mask.</td>
</tr>
<tr>
<td>Service port</td>
<td>50011</td>
<td>Scanner port number for the service protocol.</td>
</tr>
<tr>
<td>HTTP Port</td>
<td>80</td>
<td>Port number for HTTP communication (WEB-page).</td>
</tr>
</tbody>
</table>

In order for the changes to take effect, it is necessary to click the **Change** button.

28.3. "Log data" tab

The **Log data** tab displays information about the scanner operation that can be used to detect errors:

This tab is similar to that described in par. 25.
29. **Warranty policy**

Warranty assurance for Laser Scanners RF627 Series – 24 months from the date of shipping; warranty shelf-life – 12 months.

Warranty repair is not provided in the following cases:
- mechanical damage caused by impacts or falling from height,
- damage caused by opening the housing, incorrect connection, or absence of grounding.

30. **Technical support**

Technical support for issues related to incorrect work of the scanners and to problems with settings is free.

Technical support related to using the scanners is free. This kind of technical support includes consulting about ways to apply the scanner, and training to work with software tools and libraries.

Technical support for software developed by the customer is paid, and includes the possibility to add new features to software.

Technical support contacts:
- E-mail: support@riftek.com
- Skype: riftek_support

31. **Revisions**

<table>
<thead>
<tr>
<th>Date</th>
<th>Revision</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16.11.2018</td>
<td>1.0.0</td>
<td>Starting document.</td>
</tr>
</tbody>
</table>
| 28.12.2018 | 1.0.1    | 1. Added the ability to manually adjust the laser output power.  
            |          | 2. Added the description of Recovery mode, section 28.  
            |          | 3. Fixed minor inaccuracies in the description. |
| 27.06.2019 | 1.0.2    | 1. Added eleven new scanner models with ranges (Z) from 250 to 1165 mm, section 7.2.  
            |          | 2. Added settings that expand the dynamic range of scanners, section 20.1.  
            |          | 3. Added profile filtering functions (median and bilateral filters), section 20.2.  
            |          | 4. Added “Peak selection mode” function, section 20.1.1.  
            |          | 5. Added the ability to include the point brightness values in the profile package, section 19.3.  
            |          | 6. Added the modes for profile accumulation, viewing and saving profiles, building 3D and brightness models, sections 16.2., 20.3.  
            |          | 7. Changed the firmware file format, section 23.3.  
            |          | 8. Fixed minor inaccuracies in the description. |
